

Jezero

16 × 10 km
rectangle on Mars

12.8 × 8 km
at current game scale

100.0%
of rectangle now open

Sol 1980
end of saved mission route

The whole rectangle is now open in-game. Stronger teal locates the original terrain within the expansion. Gold follows NASA's saved rover track. Lettered circles remain future activity search areas, not built games. Pink indicates the stronger off-route/remote turbo emphasis, not exact pickups.

Retained: 1 Landing / floor · 2 Seitah · 3 Three Forks · 4 Kodiak · 5 Belva

New terrain: 6 Neretva / Bright Angel · 7 Western rim · 8 Fallbreen · 9 Later western traverse

The route carries the main story.

Along the rover journey

The executed journey remains the geographic guide, including its loops and revisits. It is not a built road or required campaign order. Bright Angel, the rim and Falbreen add three substantial discoveries, bringing the total to nine.

All terrain is open immediately. The original Three Forks, floor and Belva ground is retained. New landforms follow measured topography, with proportional relief and a smooth transition outside the old terrain.

Off the route

The larger landscape is traversable; the lettered game ideas remain future activities. These are search areas, not final sites. The Bright Angel survey found a gentler radar-search candidate near –3200,+500, within the broader B district.

Turbo distribution

New pickups favor off-route ground and remote reaches. The recorded route stays comparatively quiet. Exact pickup positions are authored game content, not mission evidence.

The existing 2.5× kit, ground turbo and airborne coasting are unchanged. No pickup is required to access a destination.

Candidate activity pockets

A / Track art + photo lookout

A flat drawing pad beside a reachable lookout. Camera mode comes first; protect tracks until photographed.

B / Radar sample search

A bounded off-route search pocket. Dig/stop/cancel controls and authentic science framing remain to be designed.

C / Longest-jump course

An authored run-up and clear landing area. Turbo supports the approach; preserve airborne coasting.

D / Target-jump course

A separate optional challenge, outside the Belva landmark. Launch geometry, targets and safe landing need survey.

E / Atmospheric readings

A remote science stop. Readings must be identified as simulation, not live Mars measurements.

F / Helicopter activity

Reserved optional Ingenuity-inspired game from the wider-world brief. Exact mechanics and location remain parked.

The existing Delta race stays unchanged. New activity names describe parked game ideas, not historical Perseverance operations.

How massive?

160 km² on Mars / 102.4 km² in-game. The open area is 160.00 km² on Mars / 102.40 km² in-game. The original footprint was 18.65 real km², highlighted more strongly on the map for orientation.

The final saved waypoint reports **45.13 km** of mission travel, about 36.1 km at current scale. This includes backtracking, not a straight crossing or promised play time.

What still needs review?

Physical-device performance, individual hero photographs, finer landmark artwork and optional games remain open. Measured broad terrain is not an exact reconstruction of every rock or every rover photograph.

Stock-rover checks cover the recorded western journey in both directions; that does not make every cliff driveable. The world stays rectangular and freely explorable around that route.

Evidence and limits

Saved NASA MMGIS traverse and waypoints through sol 1980, retrieved 15 September 2026; not today's live rover position. Local coordinates match the game. Horizontal spacing remains 80% of real distance.

Overview relief now uses the full 20 m USGS CTX crop, including the western strip. Gameplay retains the original detailed surfaces and adds the pinned 10 m Bright Angel survey inside the broader terrain. Terrain resolution does not establish small-obstacle or optical-camera accuracy. No new hero image is approved.
