

A world to discover.

Start at the delta. Build out a journey from the landing plain to the western rim—recognizable places, remarkable photographs, and room to explore.

- 6 DESTINATION REGIONS
- 80% HORIZONTAL SPACING
- 3x OPTIONAL SPEED CAP
- 9 + 1 CORE REVEALS + CONDITIONAL ROCK

North-up, registered to existing terrain coordinates. All unbuilt routes and the envelope are proposals, not surveyed driving terrain. Surrounding unshaded terrain remains scenery. The rim district includes a small outer-rim extension. Map span: 14 × 6.86 km on Mars, or 11.2 × 5.49 km at our scale; this is the bounding rectangle, not playable area.

Make the geography tell the story.

REGION 1 / Landing / crater floor

21 February 2021 · sol 3 · preview cropped; click for full image

The beginning of the journey

Octavia E. Butler Landing Site anchors the mission story. Keep the actual touchdown position and let its card trace the recorded journey. Broad floor terrain supplies the sense of distance and room for an authored race.

1 reveal: landing and mission history.

Second construction batch, alongside Séítah.

Touchdown reference: NASA rover frame 3_0, sol 13, no motion. This reference is not a solved camera pose for every panorama.

Mastcam-Z stitched panorama; original mosaic edges retained. [NASA source / full credits ↗](#)

Landing is a real place, not a relocated orb.

The current history orb lives inside the small playable crop. In the expanded world, the actual landing site becomes accessible; retain the recorded route overlay and distinguish the historical touchdown from our chosen player spawn.

REGION 2 / Séítah

12 September 2021 · sol 201 · preview cropped; click for full image

A rock-and-sand maze

Preserve the contrast between rough rock exposures and sand corridors. Use readable choices around the sand rather than a generic field of obstacles. The photograph supplies the surface character; route clearance needs a finer terrain survey.

1 reveal: the rocks within Séítah.

Second batch. Connect floor exploration to the delta approach.

Marker is the sol-201 camera-area waypoint, not the boundary or center of the entire formation.

PIA24816 · Mastcam-Z · enhanced color · 84-image panorama. [NASA source / full credits ↗](#)

Three Forks earns the close-up.

REGION 3 / Three Forks / western delta

22 January 2023 · sol 684 · preview cropped; click for full image

Our first finished region

Finish the depot plain, recognizable layered delta front and the Wildcat/Skinner/Hogwallow cluster. A later connection climbs through the upper delta toward Belva. Preserve the photographed forms and sightlines before adding more collectibles.

3 reveals: depot; ridge cluster; upper-delta / Belva chapter. The last needs its own approved hero image.

First batch: existing Three Forks and Kodiak sightline. Upper delta follows the floor batch.

Depot anchor: frame 32_1174, sol 684. Local samples have registered positions; exact outcrop geometry still needs reconstruction.

PIA25681 · WATSON mosaic. Existing approved depot photograph. [NASA source / full credits ↗](#)

REGION 4 / Kodiak overlook

18 April 2021 · sol 57 · preview cropped; click for full image

An iconic silhouette

Kodiak remains scenery beyond the driving edge. Its accessible viewpoint earns the discovery; the butte itself does not need to be climbable. Reproduce its layered profile and the correctly placed distant background so a player can recognize the photograph.

1 reveal: Kodiak. Collect at the overlook; face the actual butte.

First batch, as part of the Three Forks composition.

Butte position is an orbital-map anchor; current overlook is authored. The iconic photograph was taken from a different rover position, so this is not yet a matched camera pose.

PIA24802 · Mastcam-Z · enhanced color. Iconic 2021 image takes priority over novelty. [NASA source / full credits ↗](#)

One landscape, several precise stories.

Merge Hidden Harbor, Observation Mountain and Amalik into supporting Field Notes/photo sequences where appropriate. Preserve their research and collected progress. This is a proposed editorial consolidation, not an immediate removal of live discoveries. The upper-delta reveal awaits a separate hero photograph.

A journey that changes around you.

REGION 5 / Neretva Vallis / Bright Angel

12 June 2024 · sol 1178 · preview cropped; click for full image

Follow the ancient inlet

Continue along the recorded western journey into the inlet landscape and Bright Angel's contrasting rocks. The channel and its margins become the route through this district. Keep local outcrops recognizable and compress the unremarkable connecting stretches.

1 reveal: Bright Angel. Additional stops must replace a weaker entry or fit the world budget.

Fourth batch, after the upper-delta connection.

Map anchor uses the preceding recorded rover stop near the photo date, not a solved lens position or a whole-channel centroid.

PIA26369 · Mastcam-Z · 346-image panorama. Preserve published processing; no true-color claim. [NASA source](#) / [full credits](#) ↗

Recent imagery must still depict the right place.

The 2026 Lac de Charmes panorama is from outside the crater rim. Keep it as a possible later extension; do not use it to represent an inside-crater overlook. The 2025 Falbreen image is an explicit outer-rim destination. A dedicated rim look-back photograph still needs approval.

REGION 6 / Western rim / Falbreen

26 May 2025 · sol 1516 · preview cropped; click for full image

Look back across the world

The rim is the final ascent and a long view back toward the delta and floor. Include a short, explicit outer-rim continuation to Falbreen. It belongs on the far side of the rim; it must not be used as a photograph of an inner-crater overlook.

2 reveals: rim crest / look-back; Falbreen. A separate crest photograph remains to be selected.

Fifth batch. Survey slopes and vistas before committing the outer boundary.

Falbreen marker is the preceding rover waypoint near sol 1516. Crest waypoint is an approach-area reference, not a confirmed summit camera.

PIA26644 · Mastcam-Z panorama. Published color processing; original mosaic gaps retained. [NASA source](#) / [full credits](#) ↗

Less empty travel. More to remember.

These are lengths of the dashed planning connections, uniformly shortened by 20%. They are not the length of Perseverance’s actual traverse. Estimates use moving averages of 20 m/s normally and 60 m/s with the kit, below the current 33.25 / 99.75 m/s straight-line caps.

Main journey + Kodiak return: 12.0 km · ~9:58 moving

Connection	Game distance	Normal	3× kit
Landing → Séítah	0.74 km	0:37	0:12
Séítah → Three Forks	1.87 km	1:33	0:31
Three Forks → Kodiak overlook	0.29 km	0:15	0:05
Three Forks → upper delta	1.47 km	1:14	0:25
Upper delta → Bright Angel	4.03 km	3:21	1:07
Bright Angel → rim crest	1.94 km	1:37	0:32
Rim crest → Falbreen	1.33 km	1:06	0:22

Includes each connection once. A return from the Kodiak spur is added to the headline time. Climbing, turns, detours and stops increase these estimates. No acceleration, collision or route simulation has been run for these unbuilt regions.

Discovery budget

Nine substantial site reveals: landing, Séítah, depot, ridge cluster, upper delta, Kodiak, Bright Angel, rim look-back and Falbreen.

One conditional addition: the 2022 balanced rock, only after its position and shape are established. Until then it remains a companion photograph.

Up to two red Mars-fact orbs: reserve for distinctive subjects such as MOXIE oxygen production or Martian sound. Research and approve the text before placing them. Maximum proposed total: twelve.

Activities share the world

The floor race reserve is an authored activity area, not an actual rover track. Its final loop needs a terrain pass. In exploration, the race course remains hidden; show it only during an active time trial.

Camera mode, drawing/track art, digging, atmospheric readings and jumping games remain parked. They can reuse finished terrain later without dictating today’s map.

The next construction pass.

1. Finish Three Forks + the Kodiak view.

Register the hero sightlines; refine delta layers and the ridge cluster; compare game views with the actual photographs. Keep existing controls, lighting and flight behavior.

2. Open the landing plain and Séítah.

Connect the true landing site, distinct sandy/rocky terrain and a floor activity reserve. Check normal-speed traversal on phone and iPad.

3. Connect the upper delta.

Survey the ascent and Belva vicinity, select its hero photograph and test a readable route onward.

4. Build Neretva / Bright Angel.

Reconstruct the channel, contrasting rocks and photo viewpoint. Retain geographic relationships through the connecting terrain.

5. Climb the western rim.

Establish the look-back vista and safe driving boundary, then the short Falbreen extension beyond the crest.

Finish means recognizable, informative and playable.

Each region needs a sourced hero image, established viewpoint, recognizable terrain silhouette, concise discovery card, reliable map/orb behavior and a physical-device review. The plan does not expand the playable build yet.

Evidence and limits

Relief is generated from the existing 100 m overview sampling of a USGS 20 m CTX elevation model. It can explain world composition, not resolve small cliffs, traversability or individual rocks. HiRISE image resolution is not the resolution of a height model. The current Three Forks fine terrain is a separate source.

Positions use a local spherical projection centered at 77.405° E, 18.461° N, radius 3,396,190 m, matching the existing prototype. Elevation is not compressed. Region numbers identify reference anchors, not geological boundaries. Candidate camera-area anchors use preceding rover waypoints; they are not photogrammetrically solved camera poses.

Pinned map evidence: NASA Mars 2020 rover waypoints and traverse, retained in jezero-site-audit/sources. The line shown ends at sol 1516. Source-file hashes and photo downloads: assets/sources.json.
